

7.2 Shell程序接口

■ Shell编程(openEuler)

利用openEuler(Linux/Unix) 操作系统提供的命令，将需要完成的命令按执行次序写成文件，形成所谓shell程序文件。

执行这类文件，可以实现一批命令的自动执行。

The screenshot shows a terminal window titled "root@localhost:~ - Root 控制台 - Konsole". The window contains a shell script named "ex1" with the following content:

```
cat ex1
# If no arguments, then listing the current directory.
# Otherwise, listing each subdirectory.
if test $# = 0
then ls
else
  for i
  do
    ls -l $i | grep '^d'
  done
fi
```

The script is being edited in a text editor. The status bar at the bottom indicates the file is "shellex1" [已转换] 11L, 181C, and the cursor is at line 11, column 1.
